Introduction

The 4th progress report for WM 769 stoking rate BMP demonstration project at MEARC is focus on summarizing and analyzing data for all the years 1998-2001, also flow and annual nutrient calculation for the year 2001. The previous reports were for water quality and flow calculations during the years 2000 and 2002.

The task documented in this report include:

- ?? Rainfalls Summary 1998-2001
- ?? Runoff Summary 1998-2001;
- ?? Concentrations Summary 1998-2001;
- ?? Mean concentrations and loads summary based on different treatment 1998-2001;
- ?? Back flow, runoff, and combined flow concentrations summary for 2001;
- ?? Annual load assessment 1998-2001;
- ?? Load summary for TP, NH₄, NO_x, TKN, Ortho-P parameters 2001;
- ?? Load summary for summer and winter plots 2001;
- ?? QA/QC analysis results 2001.

Methods

The weather data was collected with the Buck Island Ranch from four weather stations: the main weather station, summer weather station, and two winter stations. These data were in raw form mainly on hourly time interval. They were summarized into daily and monthly averages and monthly and annual totals as appropriate. Gaps in the data have been identified and documented and, where possible, patched up with available data.

The flow data was collected from the Buck Island ranch from sixteen summer and winter plots. The flumes upstream and downstream readings were collected from data logger every 20 minutes interval, and data were formatted in row for all summer and winter plots. The flow was calculated by formulas in spreadsheets for every 20 minutes interval and results for summary report were summarized into yearly averages for all sites. Gaps in the data have been identified, documented and, where possible, patched up with available data.

The nutrient loads were calculate for TP, NH₄, NO_x, TKN, Ortho-P parameters, by formula "concentrations multiply by flow" for every 20 minutes interval, and then summarize into annual nutrient averages for all parameter for all summer and winter sites.

For Flow and nutrient load calculations we did double check and calculate runoff and nutrient load result in two different ways. To estimate runoff we took average flow (cfs) value from spreadsheets convert it to cubic meters per second (cms), multiply it (cms) by time (s)[s/year] and in result we have how much water we have for all year in (cm), then we took the quantity (cm) and divided it by area (sm), and in result we have runoff depth in meters. The same calculations we did in Americans unit systems. There were no differences between spreadsheet result and runoff depth calculated by formulas.

To estimate nutrient load we took Net flow total (liters) and multiply it by concentration's yearly average (mg/l), and divided by 1000000, in result we have a quantity of loads in (kg). The quantity we divide by area (ha) and in consequence we have nutrient load kg/ha for the year. The spreadsheets results for summer pastures was approximately 1.37 times bigger than load calculate by formulas, and for winter pastures was opposite the calculated result was 1.20 time bigger than data results form spreadsheets. All results for each site are represented in table 1.

Table 1. Results Summary.

Rainfalls Summary 1998-2001

The rainfall data was collected with the Buck Island Ranch from four weather stations: the main weather station, summer weather station, and two winter stations. Results were summarized into yearly averages and represented in table 2.

Table 2. Summary for rainfall's yearly averages in inches given by the four weather stations at Buck Island Ranch during the years 1998, 1999, 2000 and 2001.

Year	Main (in)	Main (cm)	Summer	Winter-1	Winter-2	BIR Avg	FAWN@ona	Yearly av.
1998	54.50	138.43	33.00	27.70	29.10	36.10	43.00	51.69
1999	45.20	114.81	2.30	37.90	50.60	34.00	53.10	48.27
2000	29.20	74.17	23.50	24.10	53.00	32.50	25.30	37.40
2001	50.70	128.78				50.70	59.90	72.52
4 year av.	44.90	114.05	19.60	29.90	44.23	38.33	45.33	52.47

Table 3. Represents the Runoff volume, TP concentration, and nutrient load for all 4 years 1998, 1999, 2000, and 2001. The NOx concentrations for w2 there are very high we have like 10 results ~1mg/l – 3.4mg/l.

Table 3. Summary table for rainfall's, Runoff volume, TP concentration, and Nutrient Load yearly averages during the years 1998, 1999, 2000 and 2001.

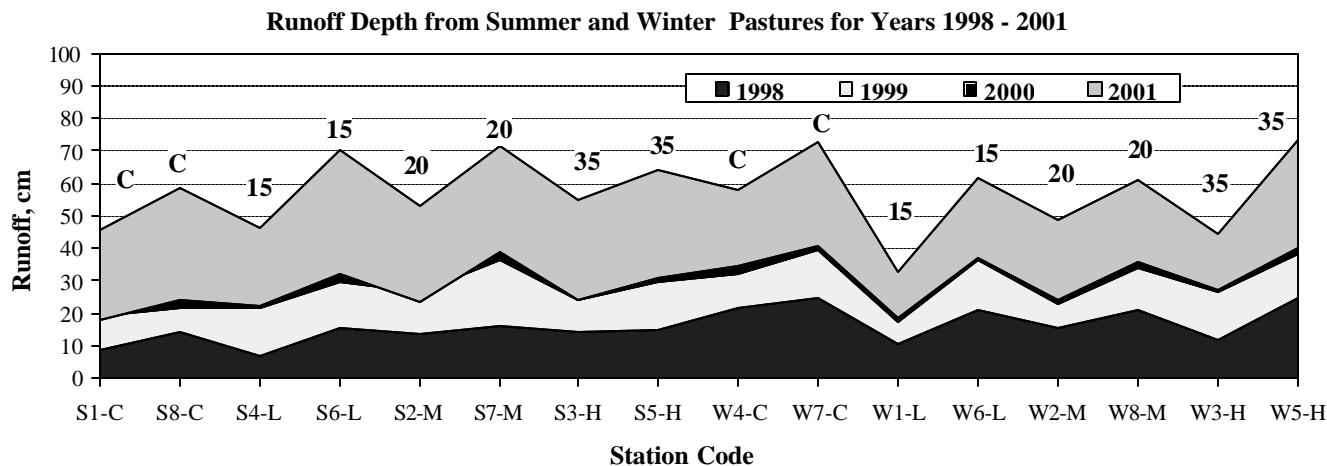

Figure 1. Total runoff depth results calculated for summer and winter pastures blocks in the years 1998, 1999, 2000, and 2001.

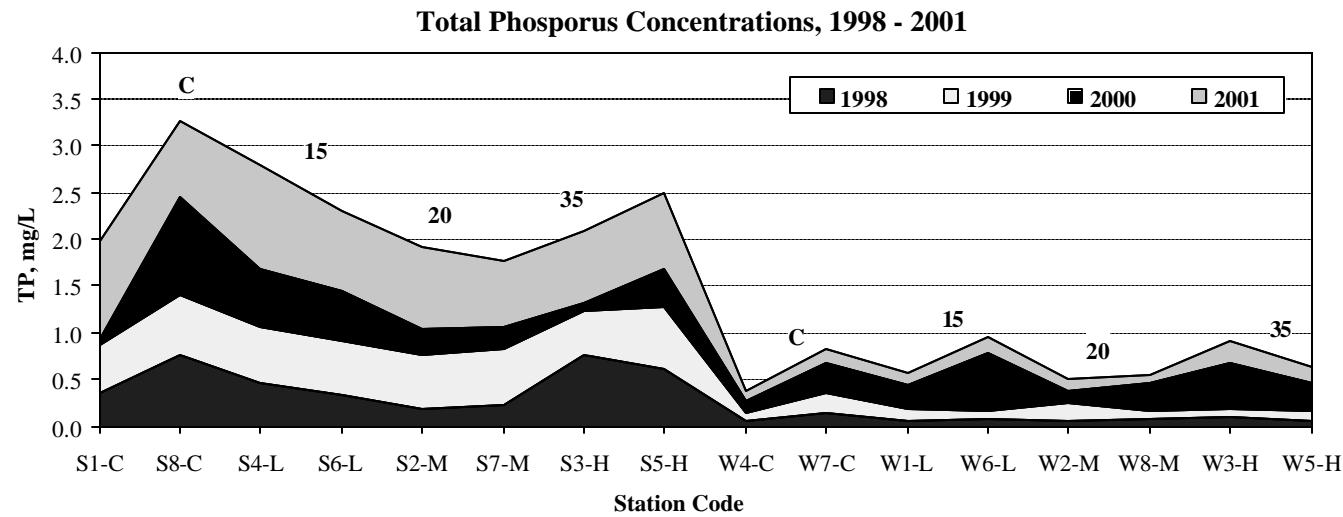

Figure 2. Summary statistics for ISCO samples Total P concentration results from summer and winter pastures for the year 1998, 1999, 2000, and 2001 showing mean phosphorus concentrations in mg/L.

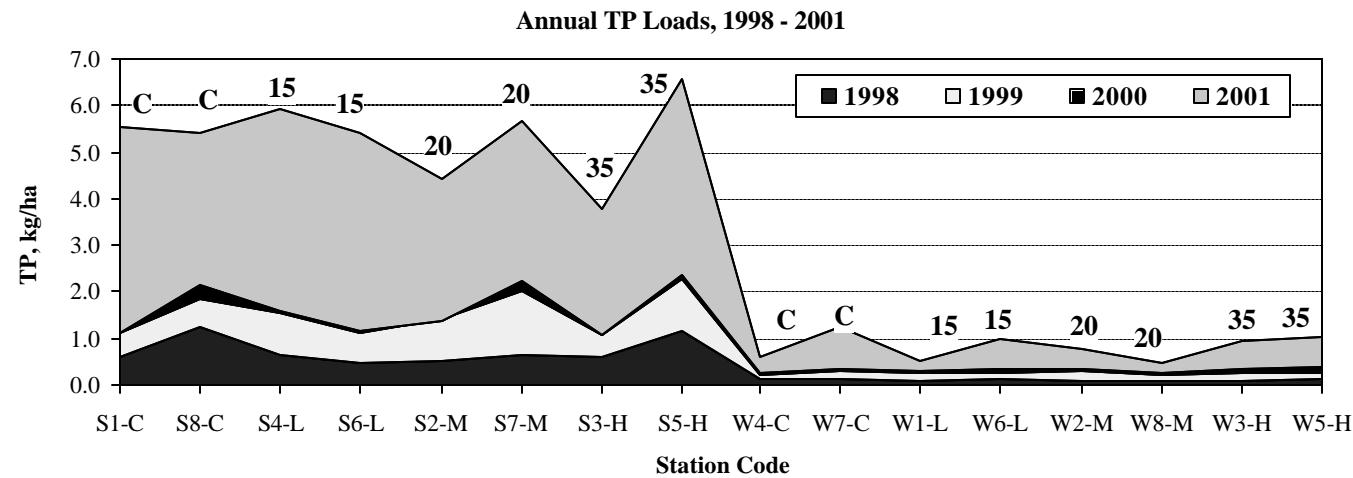

Figure 3. Comparison of nutrient loads calculated using TP concentrations from ISCO and grab samples collected from summer and winter pastures in the years 1998, 1999, 2000, and 2001.

Summary of mean concentration and load 1998-2001

This section represents NH4, NOx, TKN, and Total Phosphorus concentrations and Nutrient loads treatments yearly averages. The highest concentrations averages are basically for the year 2001 except for TKN concentrations, they are lowest.

Special attention requires NOx concentration standard. Like you may note for winter (medium) pastures in year 2000 and 2001 the yearly average has the highest value 0.83mg/l and 0.20mg/l, this is because in the same W2 pasture for 2000 and 2001 we having the highest concentrations, averages are 1.56 mg/l and 0.38 mg/l. And overall the NOx concentrations has been increased for the year 2001.

Site	Treatment	NH4				NOX				TKN				TP

Conclusions

We had more result for the year 2001 than for 2000, and that's way we can provide more confident information then for the year 2000. This report basically summarizes and represents data comparison for 1998 - 2001 years. The conclusions would be:

- ?? The highest rainfall in the year 2001 (based by one weather station),
- ?? The highest concentrations for TP, NOx, NH4, in summer pasture are for year 2001;
- ?? The highest concentrations for TP, NOx, NH4, in winter pasture are for year 2000;
- ?? The NOx concentrations increases 0.08 time compare with result for 1998-1999;
- ?? The highest Annual TP, NOX, NH4, TKN loads for the year 2001;
- ?? QA/QC test pass 32% of results;
- ?? QA/QC test for TP pass 53% of results.
